Background: Dark Matter

What exactly is dark matter?

- Can only see through gravitational influence on visible matter
 - Galactic rotation curve (Vera Rubin)
- DM in nearly spherical 'Dark Matter Halo'
- Intertwined with Stellar Halo
 - Halo stars trace DM gravitational potential
- Use halo star kinematics to infer DM distribution

Background: Spherical Jeans Equation

$$M(< r) = \frac{\bar{v}_r^2 r}{G} \left(-\frac{d \ln \rho}{d \ln r} - \frac{d \ln \bar{v}_r^2}{d \ln r} - 2\beta \right)$$

• Reminiscent of circular velocity equation

• Halo stars kinematics to get $M(<r)$

◦ Observe visible for information on invisible

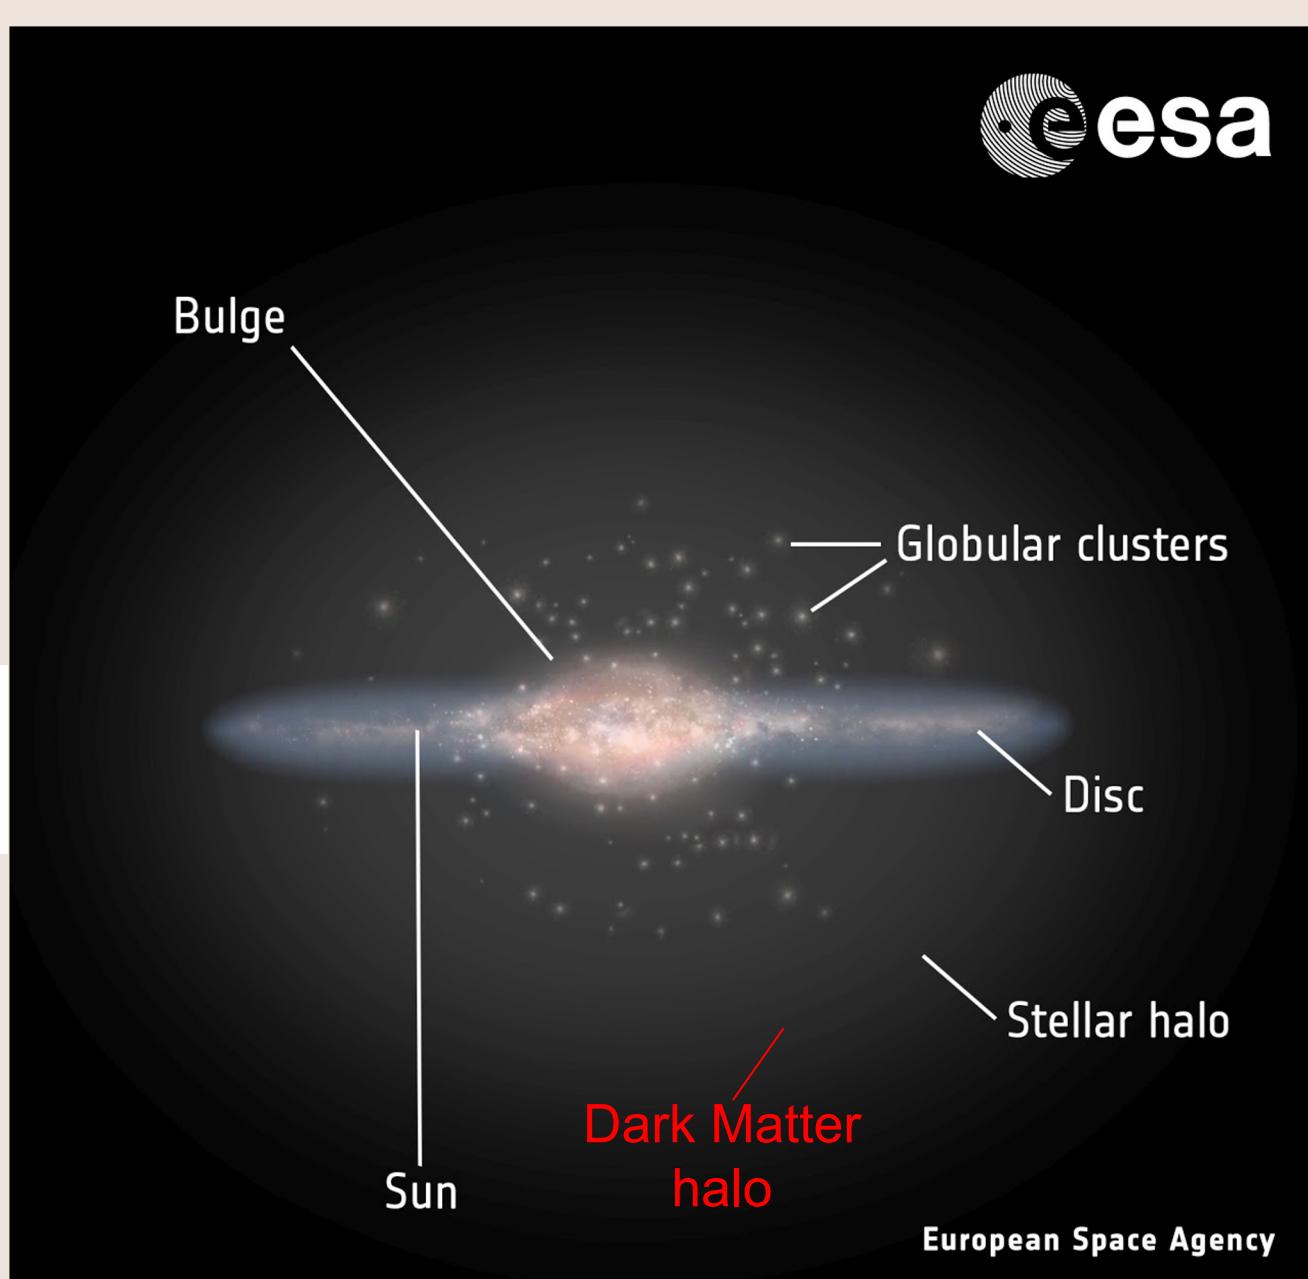

• Not a new method (Jeans 1915)

Assumptions

- Spherical symmetry
- Dynamical equilibrium

• Widely used, but errors poorly understood

• Constrain errors for application to MW

How is it distributed in a galaxy?

$$M(< r) = \frac{\bar{v}_r^2 r}{G}$$

Our Novel Routine

- Uses B-Splines
 - Unbinned, Non-parametric

Fit B-Splines to, v_r, v_ϕ, v_θ & tracer count, $C(r)$ $\rho = C/4\pi r^3$

- Numerical derivative
 - Richardson's method

Why B-Splines?

- Analytical derivatives
- No error from radial binning or forcing curve shape
- Refine implementation decisions with extensive testing

First implementation with this methodology

Testing our routine

- Why use mock data (simulations)?
 - True cumulative profile
 - Control how we break assumptions

Quantify errors introduced when breaking assumptions

- Currently, poorly understood

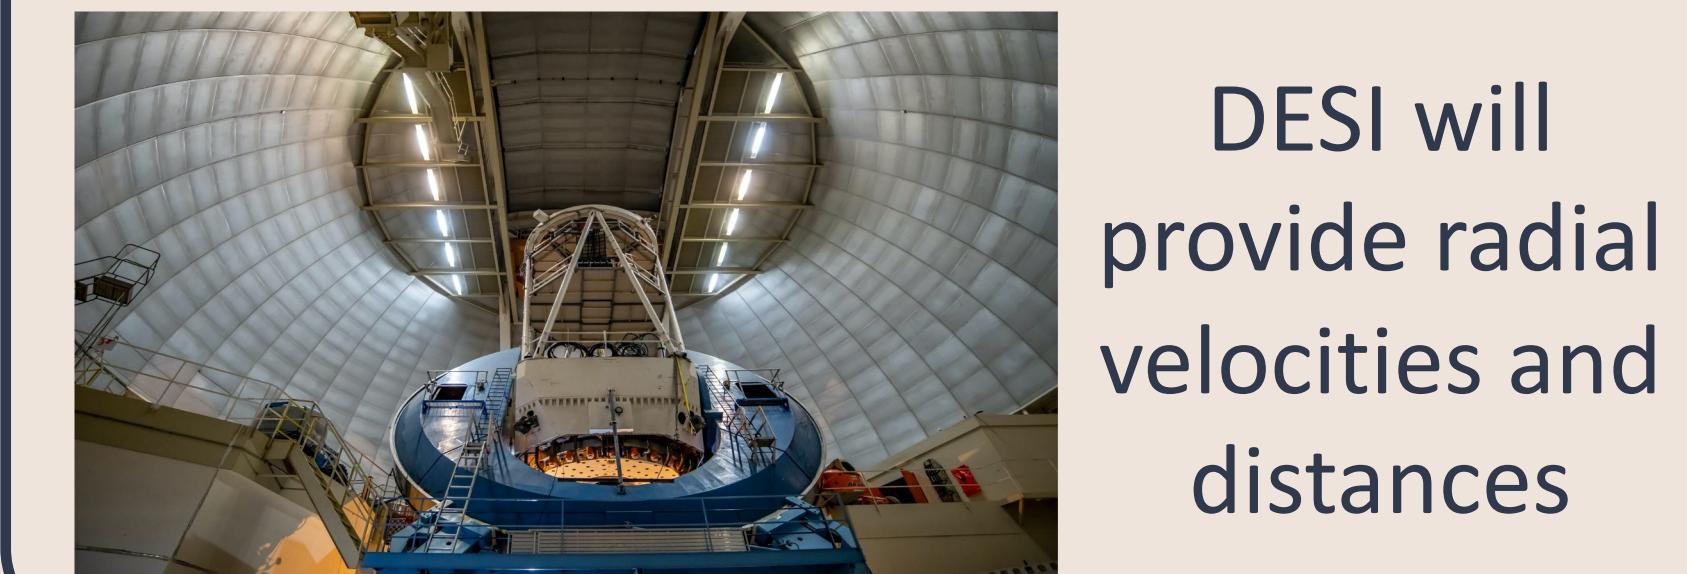

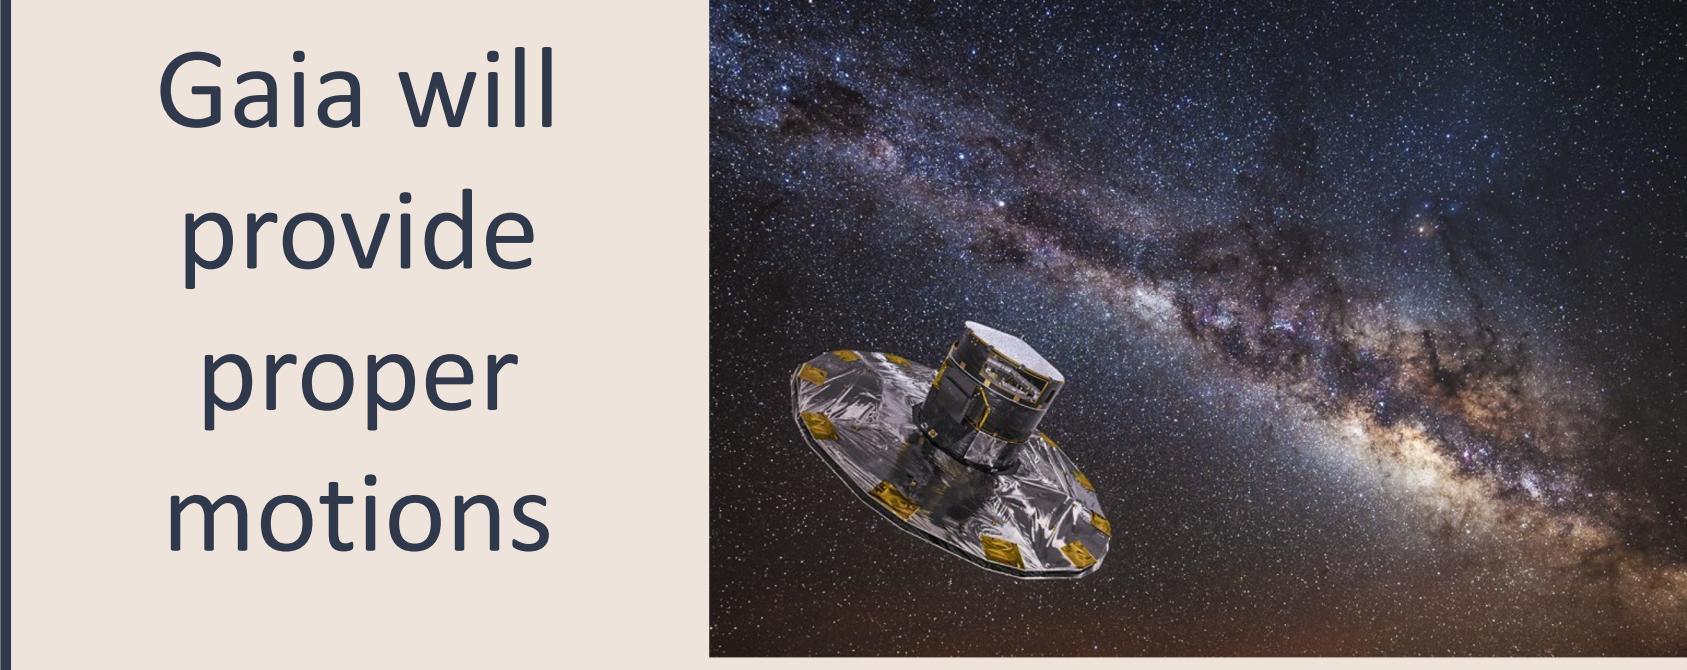

- Run our own simulations with AGAMA (Vasiliev 2019)

Progression of datasets

1. Spherical halo
2. Flattened halo (6 variants)
3. Spherical halo with disk and bulge

Application to Milky Way

- Preparation for MW Halo data from Gaia and DESI
- We will map real dark matter in the Milky Way

Jeans, J. H., 1915, MNRAS, 76, 70

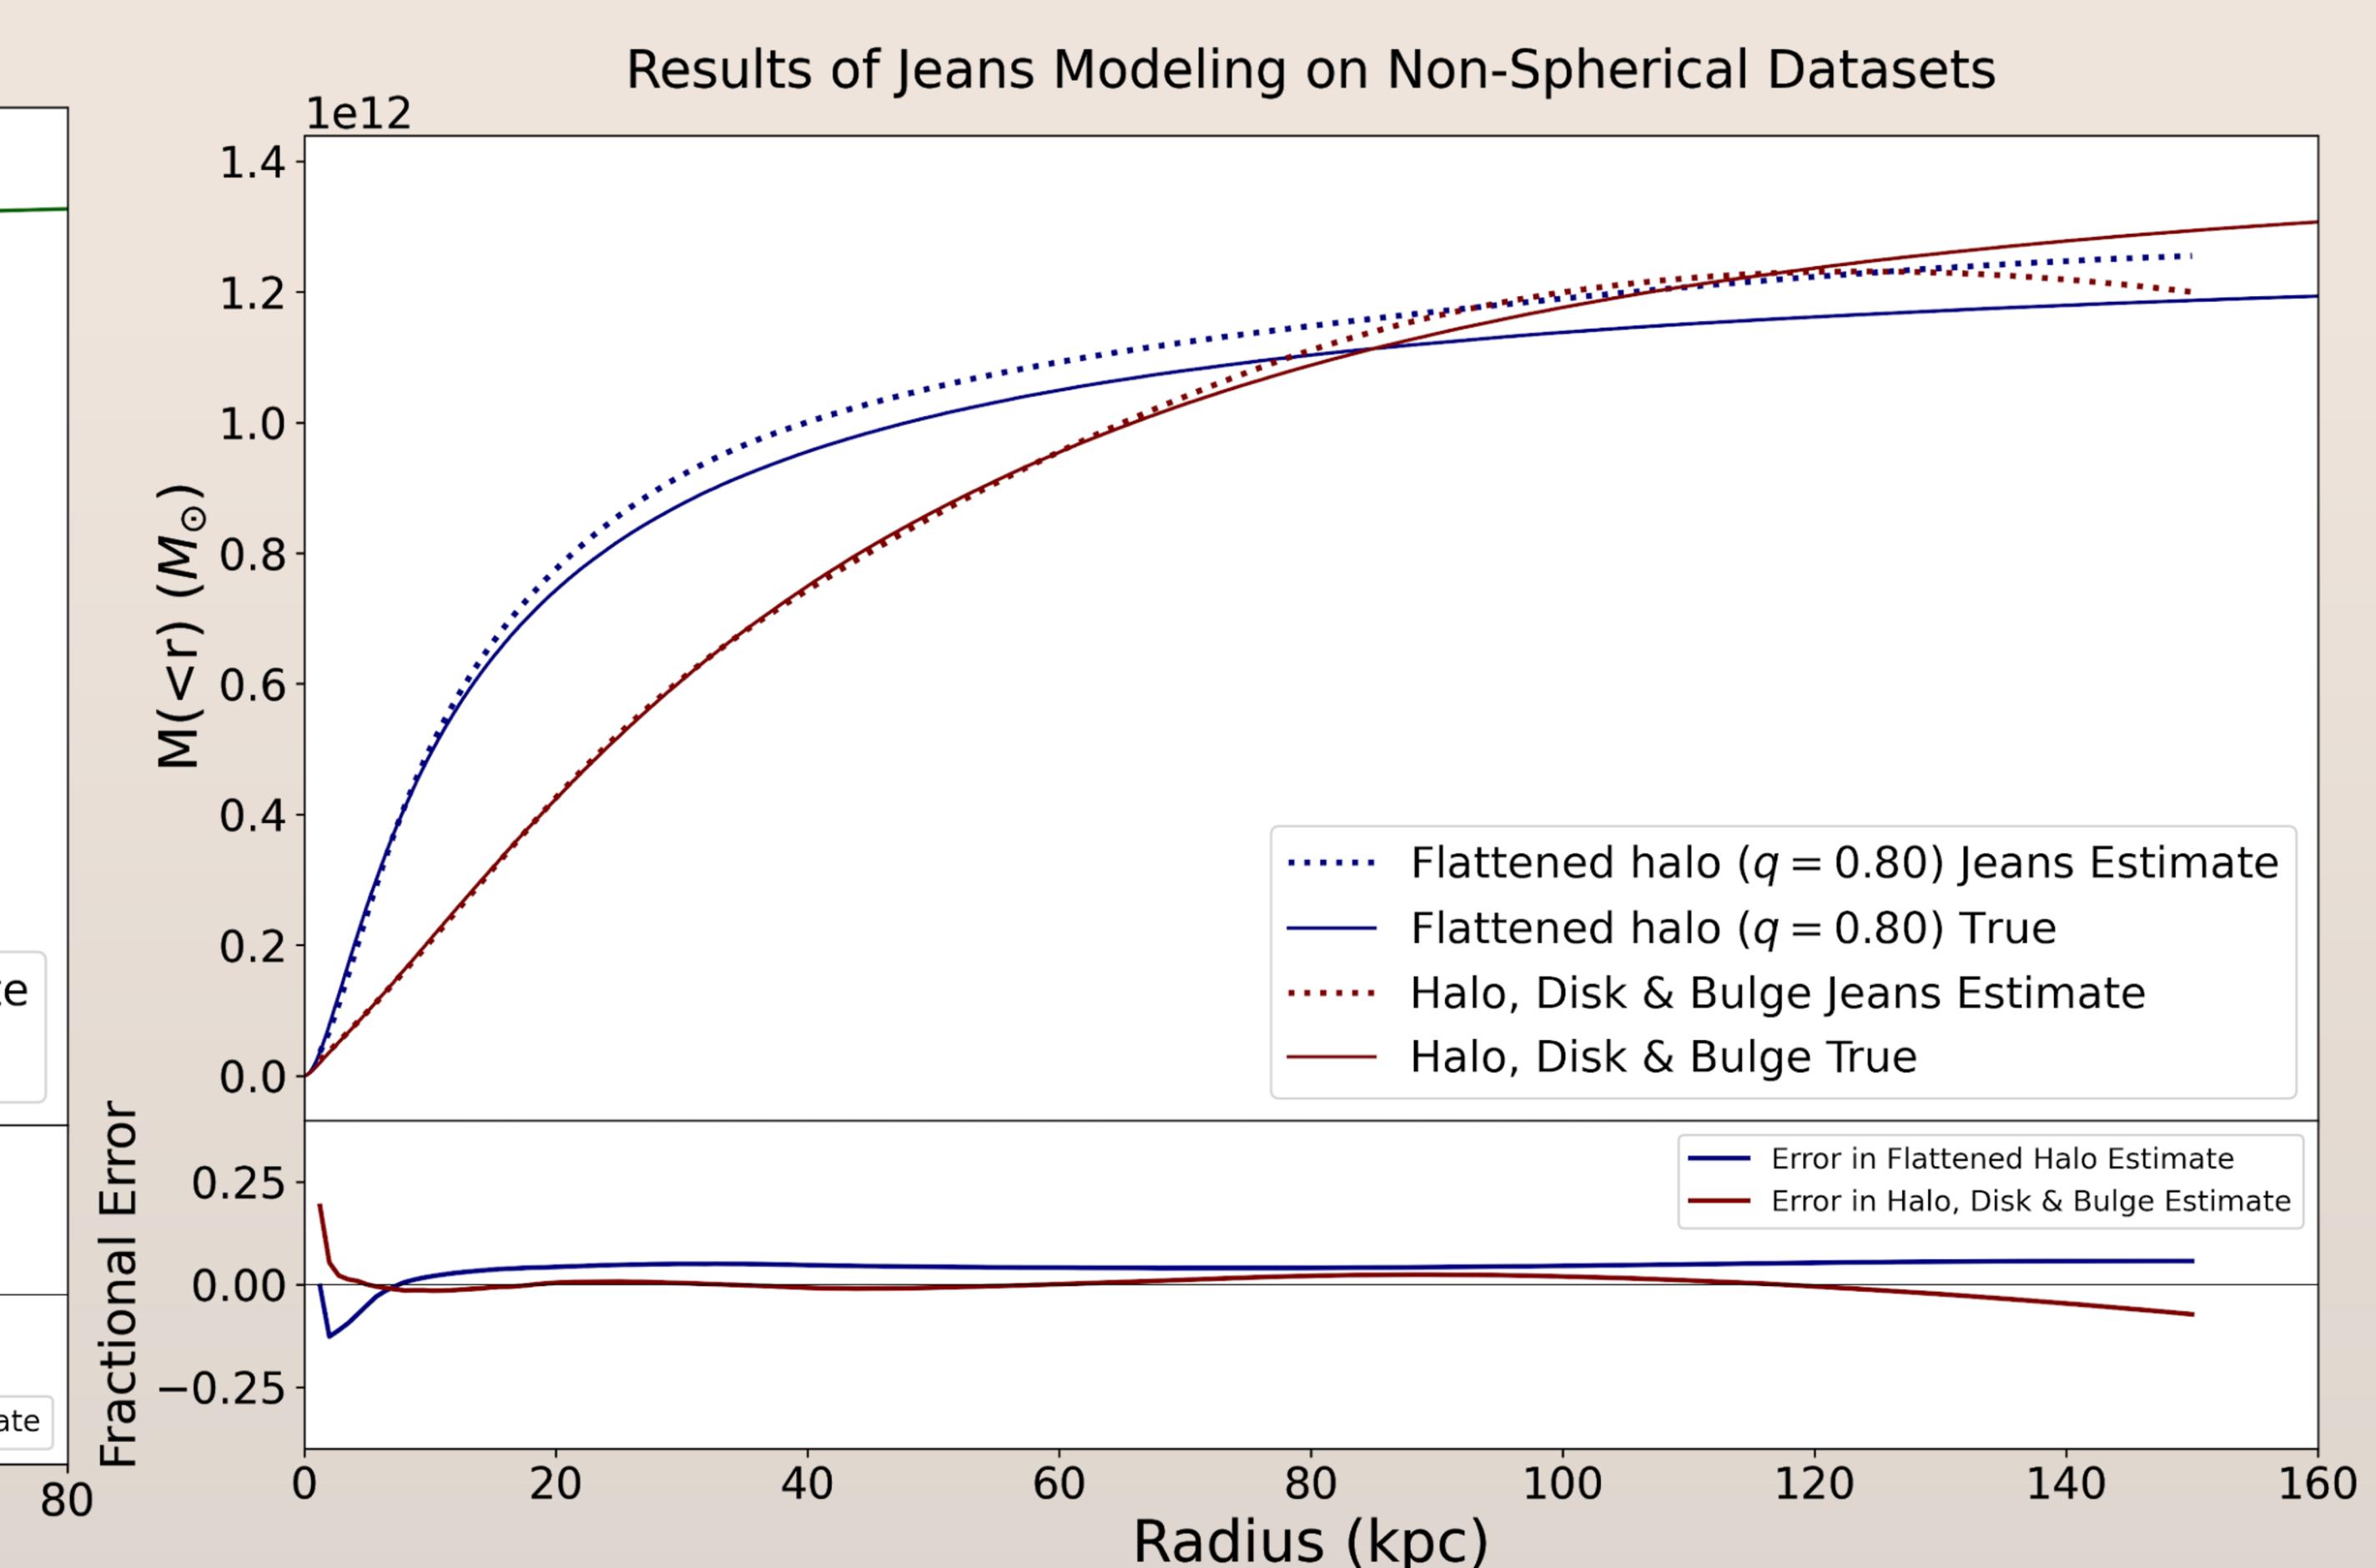

Vasiliev, E., 2019, MNRAS, 482, 1525

Results of testing

Spherical halo (axis ratio=1.00) - Satisfies both assumptions - Expect near perfect estimation

Error at small radii due to extremely high density in simulation, inconsequential to MW application

Flattened halo - (axis ratio=0.80) & Halo, Disk & Bulge Both break assumption of spherical symmetry

Mass estimation on both is very good; **breaking spherical symmetry does not introduce large errors**

M($< r$) : Mass enclosed
 r : galactocentric radius
 v_r, v_ϕ, v_θ : spherical velocity
 ρ : number density of tracers
 β : velocity anisotropy
